

SUMMARY

Data Scientist with 5 years of experience in machine learning, NLP, and statistical modeling, specializing in optimizing business performance. Key achievements include reducing data refresh time by 87.5% and accelerating analysis time by 80%, driving revenue growth. Proficient in Python, Azure, and advanced analytics tools, with expertise in Generative AI and predictive modeling.

SKILLS

Programming Languages: Python, MySQL, Oracle SQL

Data Science and Machine Learning Tools: Numpy, Pandas, Pyspark, Matplotlib, Tensorflow, LightGBM, ARIMA, Hugging Face Transformers, Keras, MS Excel, PowerBI, NLP(SpaCy, BERT), Generative AI

Cloud technology: Azure, Azure Databricks, Azure Data Factory, MS Fabric

Additional Tools: Git, Jira, Azure Devops

EXPERIENCE

ERNST & YOUNG(EY), BENGALURU : **Consultant - Data & Analytics** **May 2023 - Present**

- Led the migration of location data from an acquired company's system to the client's target system, developing a custom NER model to extract and parse address components, reducing manual effort by **50%**.
- Built a data pipeline that reduced data refresh and reporting time from 8 days to 1 day, created comprehensive reports and executed data testing scenarios to address inconsistencies.

HIGHRADIUS, HYDERABAD: **Associate Software Engineer - II** **Jul 2021 - May 2023**

- Identified customers who are at risk of exceeding their credit limits, allowing analysts to intervene before defaults occur. This strategic approach facilitated the timely clearance of existing invoices and maintained credit health.
- Developed a **predictive model using Random Forest**, utilizing historical order data, to accurately forecast order amounts for the upcoming seven days, achieving **70% prediction accuracy**. Integrated this model with a payment prediction system to assess and predict credit exposure, effectively identifying customers at risk of defaulting on their credit limit.
- **Reduction in TAT of analysis** by **~40%** to resolve the blocked orders by credit analysts.
- Developed a system predicting the **likelihood of blocked orders** being released, based on historical order data. This includes suggestions for action.
- Created a **binary classification model (Lightgbm)**, achieving an average **recall of 0.78**.
- Reduced **TAT** for analysis by **~40%**, enabling faster resolution of blocked orders.

HIGHRADIUS, HYDERABAD: **Associate Software Engineer - I** **May 2020 - Jul 2021**

- Enhanced operational efficacy and monetization for stakeholders by strategically identifying high-risk customers. **Implemented a regression model, Random Forest, achieving 86% accuracy**, based on 72 derived features to predict client payment timelines.
- Accelerated payment recovery for **~70%** of invoices, enabling an increase in goods for sale.
- Deployed a time-series model for predicting cash flows over two weeks, improving financial planning accuracy.
- Devised and fine-tuned an **ARIMA-based forecasting model**, achieving a **Mean Absolute Percentage Error (MAPE) of 6.7%** in cash flow predictions.
- Outperformed the client's previous solution, **reducing MAPE by approximately 15%**, thereby significantly improving the precision of cash flow forecasts.

EDUCATION

KIIT University, BHUBANESWAR

Bachelor of Technology in Information Technology

Jun 2016 – Mar 2020
